

# Project Goal

- Why EVM?
- Why multisine?
- MEVM

1

# Questions

- What would be the tests necessary to compare EVM and MEVM?
- Differences seen (and their test conditions) for different signals and setups?
  - Are there distortions seen in the system for a digital signal that a multisine would not pick up?

2

# Questions

- How can the intermodulation of a piece of equipment effect EVM vs. MEVM given that they are derived from different signals?
- Would a bursted multisine be more comparable to a bursted digital signal?
  - Are there time-domain effects that would not be picked up by a CW multisine?
